Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid (Art. 99(1) European patent convention).

Description

Background of the Invention:

5 Field of the Invention:

The present invention relates to an optical material which comprises an N-alkyl-substituted maleimide-olefin copolymer, and which is superior in transparency, heat resistance, surface hardness, mechanical strength, and other properties.

10 Description of the Related Art:

Heretofore, optical materials are generally made of glass. Recently, transparent polymer materials have come to be used for optical materials in view of the productivity, light-weight, and cost.

Such polymer materials includes polymethyl methacrylate (hereinafter referred to as "PMMA") and polycarbonate (hereinafter referred to as "PC").

PMMA, however, is limited in its use because of its insufficient heat-resistance resulting from its glass transition temperature (Tg) of about 100 °C, although it has superior optical characteristics.

PC, which has a Tg of about 140 °C and has relatively high heat resistance, involves the disadvantages of poorer optical characteristics in comparison with PMMA, low surface hardness causing susceptibility to scratching, low weatherability, and low moldability.

On the other hand, maleimide type copolymers are being studied comprehensively because of its high heat resistance. For example, copolymerisation of the aforementioned methyl methacrylate with N-aromatic-substituted maleimide is disclosed in Japanese Patent Publication No. Sho 43-9753, Japanese Patent Application Laid-Open Nos. Sho 61-141715, Sho 61-171708, and Sho 62-109811; and copolymerization of styrene resin with N-aromatic-substituted maleimide is disclosed in Japanese Patent Application Laid-Open Nos. Sho 47-6891, Sho 61-76512, and Sho 61-276807. The resins produced by these methods are improved more in heat resistance with the higher content of N-aromatic-substituted maleimide, but thereby causing problems of brittleness, low moldability, and lowered transparency, thus being limited in use for optical materials.

JP-A-61-278509 discloses an optical base disc formed from a polymer constituted of 5-60 wt% of an N-alkylmaleimide, like N-methylmaleimide or N-cyclohexylmaleimide, and 40-95 wt% of at least one aromatic vinyl monomer.

After comprehensive study regarding the above problems, it was found that an optical material comprising an N-alkyl-substituted maleimide-olefin type copolymer solves the problems, and the present invention has been accomplished.

Summary of the Invention:

The present invention intends to provide an optical material which is superior in transparency, heat resistance, surface hardness, mechanical strength, and other properties.

The present invention provides an optical material, comprising a resin composed of a polymer constituted of 50 to 98 mol %, based on the polymer, of a first structural unit composed of at least one of the compounds represented by the formula (I) and 50 to 2 mol %, based on the polymer, of a second structural unit composed of at least one of the compounds represented by the formula (II), and having a weight-average molecular weight of from 1×10^3 to 5×10^6 measured by gel permeation chromatography (GPC) with standard polystyrenes for calibration:

where R₁ denotes an alkyl group having 1 to 18 carbons or a cycloalkyl group having 3 to 8 carbons;

where R₂ denotes hydrogen or an alkyl group having 1 to 8 carbons, and R₃ and R₄ denote respectively an alkyl group having 1 to 8 carbons.

Detailed Description of the Preferred Embodiment:

The resin constituting the optical material of the present invention can be derived, for example, from radical copolymerization of an N-alkyl-substituted maleimide with an olefin.

The compounds which give the structural unit (I) are N-alkyl-substituted maleimides such as N-methylmaleimide, N-ethylmaleimide, N-n-propylmaleimide, N-isopropylmaleimide, N-n-butylmaleimide, N-isobutylmaleimide, N-s-butylmaleimide, N-t-butylmaleimide, N-n-pentylmaleimide, N-n-hexylmaleimide, N-n-heptylmaleimide, N-n-octylmaleimide, N-laurylmaleimide, N-stearylmaleimide, N-cyclopropylmaleimide, N-cyclobutylmaleimide, and N-cyclohexylmaleimide. These may be used singly or used combinedly in polymerization. The combination ratio thereof is not limited.

The compounds which give the structural unit (II) are olefins such as isobutene, 2-methyl-1-butene, 2-methyl-1-pentene, 2-methyl-1-hexene, 1-methyl-1-heptene, 1-isooctene, 2-methyl-1-octene, 2-ethyl-1-pentene, 2-methyl-2-butene, 2-methyl-2-pentene, and 2-methyl-2-hexene. These may be used singly or used combinedly in polymerization. The combination ratio thereof is not limited.

The content of the structural unit (I) is in the range of from 50 to 98 mol %, preferably from 50 to 75 mol % of the whole polymer. At the content of the structural unit of 98 mol % or higher, the resulting polymer is brittle unpreferably.

An additional vinyl monomer may be copolymerized within the range in which the object of the present invention is achievable. The additional vinyl monomer includes styrene, α -methylstyrene, vinyltoluene, 1,3-butadiene, isoprene, and their halogenated derivatives; methacrylic esters such as methyl methacrylate, ethyl methacrylate, cyclohexyl methacrylate, phenyl methacrylate, and benzyl methacrylate; acrylic esters such as methyl acrylate, ethyl acrylate, butyl acrylate, cyclohexyl acrylate, phenyl acrylate, and benzyl acrylate; vinyl esters such as vinyl acetate, and vinyl benzoate; vinyl ethers such as methyl vinyl ether, ethyl vinyl ether, propyl vinyl ether, and butyl vinyl ether; vinyl chloride, vinylidene chloride, maleic anhydride, N-phenylmaleimide, N-carboxyphenylmaleimide, acrylonitrile, ethylene, propylene, 1-butene, 2-butene, and 1-hexene, or two or more of their combination.

The polymerization may be conducted by any known polymerization process including bulk polymerization, solution polymerization, suspension polymerization, and emulsion polymerization, among which the solution polymerization is particularly preferable.

The polymerization initiator includes organic peroxides such as benzoyl peroxide, lauryl peroxide, octanoyl peroxide, acetyl peroxide, di-t-butyl peroxide, t-butylcumyl peroxide, dicumyl peroxide, t-butyl peroxyacetate, and t-butyl peroxybenzoate; and azo type initiators such as 2,2'-azobis(2,4-dimethylvaleronitrile), 2,2'-azobis(2-butyronitrile), 2,2'-azobisisobutyronitrile, dimethyl-2,2'-azobisisobutylate, and 1,1'-azobis(cyclohexane-1-carbonitrile).

The solvent useful in the solution polymerization includes benzene, toluene, xylene, ethylbenzene, cyclohexane, dioxane, tetrahydrofuran, acetone, methyl ethyl ketone, dimethylformamide, isopropyl alcohol, and butyl alcohol.

The polymerization temperature is suitably determined depending on the decomposition temperature of the initiator. Generally the polymerization is conducted preferably in the range of from 40 to 150 °C.

The weight-average molecular weight of the resulting polymer can be measured by gel permeation chromatography (GPC) with standard polystyrenes for calibration. The molecular weight of the resin of the present invention is in the range of from 1×10^3 to 5×10^6 , preferably from 1×10^4 to 5×10^5 . The polymers having molecular weight of higher than 5×10^6 are poor in moldability, while the polymers having molecular weight of lower than 1×10^3 are brittle.

The remaining monomer contained in the polymer is not more than 3 % by weight, preferably not more than 1 % by weight, particularly preferably not more than 0.1 % by weight. If the resulting monomer content

exceeds 3 % by weight, the polymer tends to lose transparency, causing disadvantage. The optical material of the present invention is constituted of a resin having yellowness index (YI) of not higher than 20, preferably not higher than 10, more preferably not higher than 5, as measured with a test specimen of 0.8 mm thick by a color computer (made by Suga Shikenki K.K.).

The aforementioned resin may also be produced by post-imidation of a copolymer resin of maleic anhydride and an olefin by use of alkylamine. Such post-imidation reaction can be conducted, for example, by dissolving or dispersing a maleic anhydride-isobutene copolymer in a solvent such as an alcohol like methanol, ethanol, or propanol, or an aromatic solvent like benzene, or toluene, and then reacting it with a primary amine like methylamine at a temperature of from 100 to 350 °C. However, the polymer produced by such a post-imidation reaction is liable to be colored or to become poor in heat stability. Therefore, the optical material of the present invention is preferably synthesized by radical copolymerization of an N-alkyl-substituted maleimide with an olefin.

The resin of the present invention may contain a hindered phenol, a heat stabilizer such as organic phosphate esters, a benzotriazole type UV absorbing agent, a hindered amine type UV stabilizer, a lubricant, or a dye. Further, the resin of the present invention may be blended with another compatible resin, if necessary.

The resin of the present invention can be molded by an ordinary molding process including injection molding, extrusion molding, compression molding, and spin-coating.

The resulting molded articles are useful for optical lenses, optical fibers, optical disc and card substrates, prisms, automobile lenses, signal lenses, and illumination parts.

Optical lenses are exemplified by spherical and non-spherical lenses such as compact disk lenses, video lenses, camera lenses, and eyeglass lenses. For these uses, the lenses are desired to have light transmittance of not lower than 80 %, preferably not lower than 90 %; refractive index of not less than 1.49, preferably not less than 1.50; Abbe's number of not less than 35, preferably not less than 45; glass transition temperature of not lower than 100 °C, preferably not lower than 120 °C, still more preferably not lower than 140 °C; linear expansion coefficient of not more than $10 \times 10^{-5} \cdot \text{C}^{-1}$, preferably not more than $7 \times 10^{-5} \cdot \text{C}^{-1}$, still more preferably not more than $6 \times 10^{-5} \cdot \text{C}^{-1}$; and surface hardness (pencil hardness) of H or higher.

For optical fiber uses, the resins are desired to have light transmittance of not lower than 80 %, preferably not lower than 90 %; refractive index of not less than 1.45, preferably not less than 1.50; glass transition temperature of not lower than 100 °C, preferably not lower than 120 °C, still more preferably not lower than 140 °C; light transmission loss at 646 nm of not more than 5000 dB/km, preferably not more than 3000 dB/km, still more preferably not more than 1000 dB/km; and flexural modulus of not less than 25000 kg/cm², preferably not less than 30000 kg/cm².

For use for optical disk substrates, the resin is desired to have light transmittance of not less than 80 %, preferably not less than 85 %; refractive index of not less than 1.49; birefringence of not more than 100 nm, preferably not more than 50 nm; surface hardness of not lower than H, preferably not lower than 2H, more preferably not lower than 3H; and flexural modulus of not less than 25000 kg/cm², preferably not less than 30000 kg/cm², still more preferably not less than 40000 kg/cm². If necessary, the disk may be further surface-treated for hard coat.

Automobile lenses include headlight lenses, fog-light lenses, turn indicator lenses, and brake light lenses. Illumination parts include illumination covers, and illumination accessories. For uses for such automobile lenses, illumination parts, and signal lenses, the resins are desired to have light transmittance of not less than 80 %, preferably not less than 85 %; surface hardness of not lower than H, preferably not lower than 2H, still more preferably not lower than 3H; refractive index of not less than 1.49, preferably not less than 1.50; glass transition temperature of not lower than 110 °C, preferably not lower than 130 °C, still more preferably not lower than 150 °C; and light resistance giving yellowness index change of not more than 20, preferably not more than 10, still more preferably not more than 3 in 200 hours of a UV-accelerated test. If necessary, the lens may be further surface-treated for hard coating.

The present invention is described by reference to examples without limiting the invention thereto in any way.

The molecular weight of the resulting polymer was measured by means of GPC (HLC-802A, made by Tosoh Corporation) in polystyrene equivalent.

The Tg of the resulting polymer was measured in nitrogen atmosphere at a temperature elevation rate of 10 °C/min. by means of DSC200 (Differential Scanning Colorimeter made by Seiko Denshi K.K.).

The decomposition temperature (Td) of the resulting polymer was measured in nitrogen atmosphere at a temperature elevation rate of 40 °C/min. by means of TG/DTA200 (made by Seiko Denshi K.K.).

The softening temperature and the linear expansion coefficient was measured under loading of 1.18 kg/cm² at a temperature elevation rate of 10 °C/min by means of TMA100 (made by Seiko Denshi K.K.).

The light transmittance was measured according to ASTM 1746. The refractive index and the Abbe's number were measured by use of Abbe refractometer.

5 The flexural strength, the flexural modulus (ASTM D790), and the pencil hardness (JIS K5401) were evaluated with test specimens of 80 x 12 x 3 mm formed by means of an injection molding machine (Panajection, made by Matsushita Electric Works, Ltd.).

The yellowness index (JIS K7105; Reflection method, tristimulus values of reflector - x:79.44 y:82.22 z:94.51) was evaluated with a pressed piece of 50 x 25 x 0.8 mm in size by means of a color computer
10 (made by Suga Shikenki K.K.). The light resistance of the polymer was evaluated by change of yellowness index by exposure to ultraviolet light at an intensity of 100 mW/cm² at 63 °C for 200 hours by means of Super UV Testor (made by Dainippon Plastics K.K.).

Example 1

15 55.6 g (0.5 mole) of N-methylmaleimide, 0.8 g (5.0×10^{-3} mole) of 2,2'-azobisisobutyronitrile (AIBN), and 800 ml of dioxane were placed in a 1-liter autoclave equipped with a stirrer, a nitrogen introducing tube, a thermometer, and a degassing tube. The autoclave was purged with nitrogen several times, and 56.1 g (1.0 mole) of isobutene was charged therein. The mixture was reacted at 60 °C for 10 hours.

20 The reaction mixture was poured into ethanol to deposit the polymer. The obtained polymer was purified by reprecipitation from dioxane-methanol, and was dried under reduced pressure at 60 °C for 24 hours. The yield of the polymer was 80.5 g, and the remaining monomer therein was not more than 0.1 % by weight.

The maleimide unit content in the resulting polymer was found to be 50 mol % from the elemental
25 analysis of the polymer (C: 64.7 %, H: 7.8 %, N: 8.4 % by weight). The polymer had molecular weight (Mw) = 163,000, Tg = 152 °C, and Td = 397 °C.

Example 2

30 An N-ethylmaleimide-isobutene copolymer was synthesized in the same manner as in Example 1.

The maleimide unit content of the polymer was 52 mol % from elemental analysis of the polymer. The resulting polymer had molecular weight (Mw) = 102,000, Tg = 125 °C, and Td = 390 °C.

Example 3

35 An N-isopropylmaleimide-isobutene copolymer was synthesized in the same manner as in Example 1.

The maleimide unit content of the polymer was 50 mol % from elemental analysis of the polymer. The resulting polymer had molecular weight (Mw) = 141,000, Tg = 145 °C, and Td = 389 °C.

Example 4

An N-cyclohexylmaleimide-isobutene copolymer was synthesized in the same manner as in Example 1.

The maleimide unit content of the polymer was 51 mol % from elemental analysis of the polymer. The resulting polymer had molecular weight (Mw) = 124,000, Tg = 189 °C, and Td = 398 °C.

Example 5

An N-cyclohexylmaleimide/N-methylmaleimide-isobutene copolymer was synthesized in the same manner as in Example 1.

50 The cyclohexylmaleimide unit content of the polymer was 26 mol %, the methylmaleimide content thereof was 26 mol %, and the isobutene content was 48 mol % from elemental analysis and NMR analysis of the polymer. The resulting polymer had molecular weight (Mw) = 159,000, Tg = 173 °C, and Td = 404 °C.

Example 6

55 An N-cyclohexylmaleimide-isobutene/isooctene copolymer was synthesized in the same manner as in Example 1.

The cyclohexylmaleimide unit content of the resulting polymer was 50 mol %, the isobutene unit content was 45 mol %, and isooctene unit content was 5 mol % from elemental analysis of the polymer and gas chromatograph analysis of the remaining monomer after polymerization. The resulting polymer had molecular weight (Mw) = 247,000, Tg = 201 °C, and Td = 402 °C.

Comparative Examples 1 and 2

PMMA (Acrypet, made by Mitsubishi Rayon Co., Ltd.) and PC (Panlite, made by Teijin Kasei K.K.) were employed for comparison. The glass transition temperature of the PMMA was 105 °C, and that of the PC was 141 °C. (Evaluation of mechanical properties)

Several polymerization batches of the respective samples of Examples 1 - 5 were prepared. The samples were extruded by Labo-plasto-mill (made by Toyo Seiki Co., Ltd.), and molded by small-size injection machine. The physical properties measured are shown in Table 1 together with the properties of PMMA and PC.

(Evaluation of thermal characteristics)

Softening temperatures and linear expansion coefficients of samples of Examples 1 - 6 were measured by TMA. The results of the measurement are shown in Table 2 together with the results of PMMA and PC.

(Evaluation of optical properties)

The light transmittance, the refractive index, and the Abbe's number, yellowness index were evaluated of the resins synthesized in Examples 1, 3, and 4. The results of the measurements are shown in Table 3 together with the results of the PMMA and PC.

(Evaluation of the light resistance)

The resins synthesized in Examples 1, 3, and 4 were evaluated for light resistance by accelerated test with a UV tester. The results are shown in Table 4 together with the results of PMMA and PC.

Example 7

The resins synthesized in Examples 1 and 3 were molded into disk substrates of 130 mm diameter under the molding conditions shown in Table 5. The birefringence thereof was measured at a position of 30 mm apart from the center. The results are shown in Table 5 together with the results of PMMA and PC.

Example 8

The resins synthesized in Example 1 and 3 were molded into optical fibers and evaluated for light transmission loss.

The resin was melted and extruded by a piston type extruder in a strand form, and taken out by rollers to be shaped into a strand of 1 mm in diameter. This strand was passed through a solution of 2,2,2-trifluoroethyl methacrylate polymer to prepare an optical fiber having a core-sheath structure.

The light transmission loss of the fibers was respectively 430 dB/km and 280 dB/km.

As clearly understood from the Examples, present invention provides an optical material which is superior in transparency, heat resistance, surface hardness and mechanical properties.

Claims

1. An optical material, comprising a resin composed of a polymer constituted of 50 to 98 mol %, based on the polymer, of a first structural unit composed of at least one of the compounds represented by the formula (I), and 50 to 2 mol %, based on the polymer, of a second structural unit composed of at least one of the compounds represented by the formula (II), and having a weight-average molecular weight of from 1×10^3 to 5×10^5 measured by gel permeation chromatography (GPC) with standard polystyrenes for calibration:

where R_1 denotes an alkyl group having 1 to 18 carbons or a cycloalkyl group having 3 to 8 carbons;

where R_2 denotes hydrogen or an alkyl group having 1 to 8 carbons, and R_3 and R_4 denote respectively an alkyl group having 1 to 8 carbons.

2. An optical material according to claim 1, wherein R_1 is methyl, ethyl, isopropyl, or cyclohexyl.
3. An optical material according to claim 2, wherein R_2 is hydrogen, R_3 is methyl, R_4 is methyl, ethyl or butyl.
4. An optical material according to claim 1, wherein said resin is prepared by radical copolymerization of alkylmaleimide and olefin.
5. An optical material according to claim 1, wherein said resin has a pencil hardness of not lower than H.
6. An optical material according to claim 1, wherein said resin has a yellowness index of not larger than 5.
7. An optical material according to claim 1, wherein said resin has a glass transition temperature of not lower than 120°C .
8. An optical material according to claim 1, wherein said optical material is an optical lens.
9. An optical material according to claim 1, wherein said optical material is an optical disc substrates.
10. An optical material according to claim 1, wherein said optical material is an optical fiber.
11. An optical material according to claim 1, wherein said optical material is an automobile lens.
12. An optical material according to claim 1, wherein said optical material is an illumination equipment.
13. An optical material according to claim 1, wherein said optical material is a signal lens.

Patentansprüche

1. Optisches Material, umfassend ein Harz, bestehend aus einem Polymer, gebildet aus 50 bis 98 Mol-%, bezogen auf das Polymer, einer ersten Struktureinheit, bestehend aus mindestens einer der durch Formel (I) dargestellten Verbindungen, und 50 bis 2 Mol-%, bezogen auf das Polymer, einer zweiten Struktureinheit, bestehend aus mindestens einer der durch die Formel (II) dargestellten Verbindungen, und mit einem Gewichtsmittel des Molekulargewichts von 1×10^3 bis 5×10^6 , gemessen durch Gelpermeationschromatographie (GPC) mit Standardpolystyrolen für die Kalibrierung:

wobei R_1 eine Alkylgruppe mit 1 - 18 Kohlenstoffen oder eine Cycloalkylgruppe mit 3 bis 8 Kohlenstoffen darstellt;

wobei R₂ Wasserstoff oder eine Alkylgruppe mit 1 bis 8 Kohlenstoffen darstellt und R₃ und R₄ jeweils eine Alkylgruppe mit 1 bis 8 Kohlenstoffen darstellen.

2. Optisches Material nach Anspruch 1, wobei R₁ eine Methyl-, Ethyl-, Isopropyl- oder Cyclohexylgruppe ist.
3. Optisches Material nach Anspruch 2, wobei R₂ Wasserstoff, R₃ eine Methyl-, R₄ eine Methyl-, Ethyl- oder Butylgruppe ist.
4. Optisches Material nach Anspruch 1, wobei das Harz durch radikalische Copolymerisation von Alkylmaleimid und Olefin hergestellt wird.
5. Optisches Material nach Anspruch 1, wobei das Harz eine Bleistiftritzhärte von nicht tiefer als H aufweist.
6. Optisches Material nach Anspruch 1, wobei das Harz einen Vergilbungsindex von nicht größer als 5 aufweist.
7. Optisches Material nach Anspruch 1, wobei das Harz eine Glasübergangstemperatur von nicht tiefer als 120 °C aufweist.
8. Optisches Material nach Anspruch 1, wobei das optische Material eine optische Linse ist.
9. Optisches Material nach Anspruch 1, wobei das optische Material ein Bildplattensubstrat ist.
10. Optisches Material nach Anspruch 1, wobei das optische Material eine Lichtleitfaser ist.
11. Optisches Material nach Anspruch 1, wobei das optische Material eine Automobil-Linse ist.
12. Optisches Material nach Anspruch 1, wobei das optische Material eine Beleuchtungsausstattung ist.
13. Optisches Material nach Anspruch 1, wobei das optische Material eine Signallinse ist.

Revendications

1. Matériau optique, comprenant une résine composée d'un polymère constitué de 50 à 98 % en moles, sur la base du polymère, d'une première unité structurale composée d'au moins l'un des composés représentés par la formule (I), et de 50 à 2 % en moles, sur la base du polymère, d'une deuxième unité structurale, composé d'au moins l'un des composés représentés par la formule (II), et ayant un poids moléculaire moyen de l'ordre de 1 x 10³ à 5 x 10⁶, mesuré par chromatographie à perméation de gel (GPC), des polystyrènes standards étant utilisés pour l'étalonnage :

formule dans laquelle R_1 est un groupe alkyl comportant de 1 à 18 atomes de carbone ou un groupe cycloalkyl, comportant de 3 à 8 atomes de carbone;

formule dans laquelle R_2 est l'hydrogène ou un groupe alkyl ayant de 1 à 8 atomes de carbone, et R_3 et R_4 sont respectivement un groupe alkyl ayant de 1 à 8 atomes de carbone.

2. Matériau optique selon la revendication 1, dans lequel R_1 est un radical méthyl, éthyl, isopropyl, ou cyclohexyl.
3. Matériau optique selon la revendication 2, dans lequel R_2 est l'hydrogène, R_3 est un radical méthyl, R_4 est un radical méthyl, éthyl, ou butyl.
4. Matériau optique selon la revendication 1, dans lequel ladite résine est préparée par copolymérisation, au niveau des radicaux, d'alkylmaléimide et d'oléfine.
5. Matériau optique selon la revendication 1, dans lequel ladite résine a une dureté à l'essai à la pointe non inférieure à H.
6. Matériau optique selon la revendication 1, dans lequel ladite résine a un indice de jaunissement non supérieur à 5.
7. Matériau optique selon la revendication 1, dans lequel ladite résine a une température de transition en phase vitreuse non inférieure à 120° C.
8. Matériau optique selon la revendication 1, dans lequel ledit matériau optique est destiné à une lentille optique.
9. Matériau optique selon la revendication 1, dans lequel ledit matériau optique est destiné à des substrats discoïdes optiques.
10. Matériau optique selon la revendication 1, dans lequel ledit matériau optique est destiné à une fibre optique.
11. Matériau optique selon la revendication 1, dans lequel ledit matériau optique est destiné à une lentille pour automobile.
12. Matériau optique selon la revendication 1, dans lequel ledit matériau optique est destiné à un équipement d'illumination.
13. Matériau optique selon la revendication 1, dans lequel ledit matériau optique est destiné à une lentille de signalisation.
